Dr. P. T. Edwards
Communicable Disease Center
1600 Clifton Road
Atlanta 22, Georgia

Dear Phil:

I was very pleased to hear from you. I certainly agree that it would be desirable to continue the immunogenetic studies with Salmonella, but I have to confess that at the present time we are not doing very much about it here. Dr. Helen Makela from Helsinki was a postdoctoral fellow here for some months and did some work on the patterns of sexual recombination in Salmonella that could be very important for the kind of program you mention in your letter. I hope she will be continuing those studies to some extent in Finland, and she is, of course, in close touch with Dr. Iino in Japan. I saw him not long ago, having been on a six week's visit there, and am delighted at the way he is continuing his work along these lines. He will be paying us a brief visit after the Montreal Congress later this summer.

Our own work in the lab here has turned almost completely towards the DNA transformation system in *Bacillus subtilis* because of the advantages that this gives us for getting at the biochemistry of the genetic material.

I had a letter (see enclosure) not long ago from Dr. Joys in Bruce Stocker's laboratory which I am reminded of by your remark about wanting to continue some immunogenetic work in your own lab. Can you see some possibility of using Joys's experience in a way that would allow him to continue his genetic interests in the flagella of Salmonella? I don't suppose there is tremendous scope for this at the CDC itself except perhaps as a part time activity, but I ask in the hope that you do have some relationship with the University that might make this a feasible program. I can recommend Dr. Joys as a solid citizen and as someone who certainly has had enough imagination to see a good problem and do a very interesting job with it. If there is any possibility that you might be interested I suggest you communicate with him directly. As I told you our own work has moved in a rather different direction which is why I don't take him on myself. You can probably get a closer line on him if you need this by contacting Bruce Stocker in London as well as the people he has been working with more recently.

With best regards ever,

Sincerely,

See enclosure T.M. Joys

Joshua Lederberg
Professor of Genetics
